

# Missouri Weekly Influenza Surveillance Report 2015-2016 Influenza Season<sup>1</sup>

**Week 8: February 21 – February 27, 2016**

*All data are preliminary and may change as more reports are received.*

## Summary:

- The estimated influenza activity in Missouri increased to Regional<sup>2</sup>.
- A season-to-date total of 3,981 laboratory-positive<sup>3</sup> influenza cases have been reported in Missouri. The influenza type for reported cases season-to-date includes 73% influenza A, 24% influenza B, and 3% untyped. Influenza A remains the predominant virus type reported this season, accounting for 86% of reported cases during Week 8. The highest season-to-date rates of laboratory-positive influenza cases are among children aged 0-4 years (214 cases per 100,000 population) and children aged 5-14 years (83 cases per 100,000 population). There were four laboratory-confirmed influenza cases (two cases of influenza A (H1N1), two cases of influenza B) reported by the Missouri State Public Health Laboratory (MSPHL) during Week 8.
- The Centers for Disease Control and Prevention (CDC) has antigenically characterized three influenza isolates so far this influenza season from Missouri. Two viruses were antigenically similar to the A/Switzerland/9715293/2013-like (H3N2) virus and one virus was antigenically similar to the A/California/7/2009-like (H1N1)pdm09 virus. Both an A/Switzerland/9715293/2013-like virus and an A/California/7/2009-like virus are included in the 2015-2016 Northern Hemisphere vaccine formulation.
- Influenza-like illness activity was above baseline for both the Missouri Outpatient ILI Surveillance Network (ILINet) and for the hospital emergency room visit chief complaint data reported through ESSENCE. The reported percentage of visits for ILI was 2.84% and 1.85% through ILINet and ESSENCE respectively<sup>4</sup>.
- No influenza-associated pediatric deaths have been reported in Missouri, to date, this influenza season. During Week 7, 71 deaths were reported involving Pneumonia and Influenza (P&I) reported to the Bureau of Vital Records, resulting in a season-to-date total of 1,306 P&I associated deaths in Missouri<sup>5</sup>.
- One influenza or ILI-associated outbreak has been reported in Missouri, to date, this influenza season. No influenza or ILI-associated school closures have been reported in Missouri, to date, this influenza season.
- Influenza activity increased in the U.S. during Week 7. National influenza surveillance information is prepared by the CDC and is included in the weekly FLUVIEW report, which is available online at <http://www.cdc.gov/flu/weekly/fluactivitysurv.htm>.

<sup>1</sup>The 2015-2016 influenza season in Missouri began CDC Week 40 (week ending October 10, 2015) through CDC Week 20 (week ending May 21, 2016).

<sup>2</sup>Regional is defined as: Outbreaks of influenza or increases in ILI and recent laboratory-confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions.

<sup>3</sup>Laboratory-positive Influenza includes the following test methods: rapid influenza diagnostic tests (antigen), reverse transcriptase polymerase chain reaction (RT-PCR) and other molecular assays, immunofluorescence antibody staining (Direct (DFA) or Indirect (IFA)), or viral culture.

<sup>4</sup>Influenza-like Illness (ILI) is defined by ILINet as fever (temperature of 100°F [37.8°C] or greater) and a cough and/or a sore throat without a known cause other than influenza. Influenza-like Illness (ILI) is defined by ESSENCE as Emergency Department chief complaints that contain keywords such as “flu”, “flulike”, “influenza” or “fever” plus “cough” or “fever” plus “sore throat”.

<sup>5</sup>The P&I data are available one week later. The P&I data for the CDC Week provided is the most current data available.

\* The ESSENCE ILI Baseline is the mean percent of ILI visits for each week during the previous three years (2012-14) when percentage of ILI visits were less than 2% of total visits, plus two standard deviations.

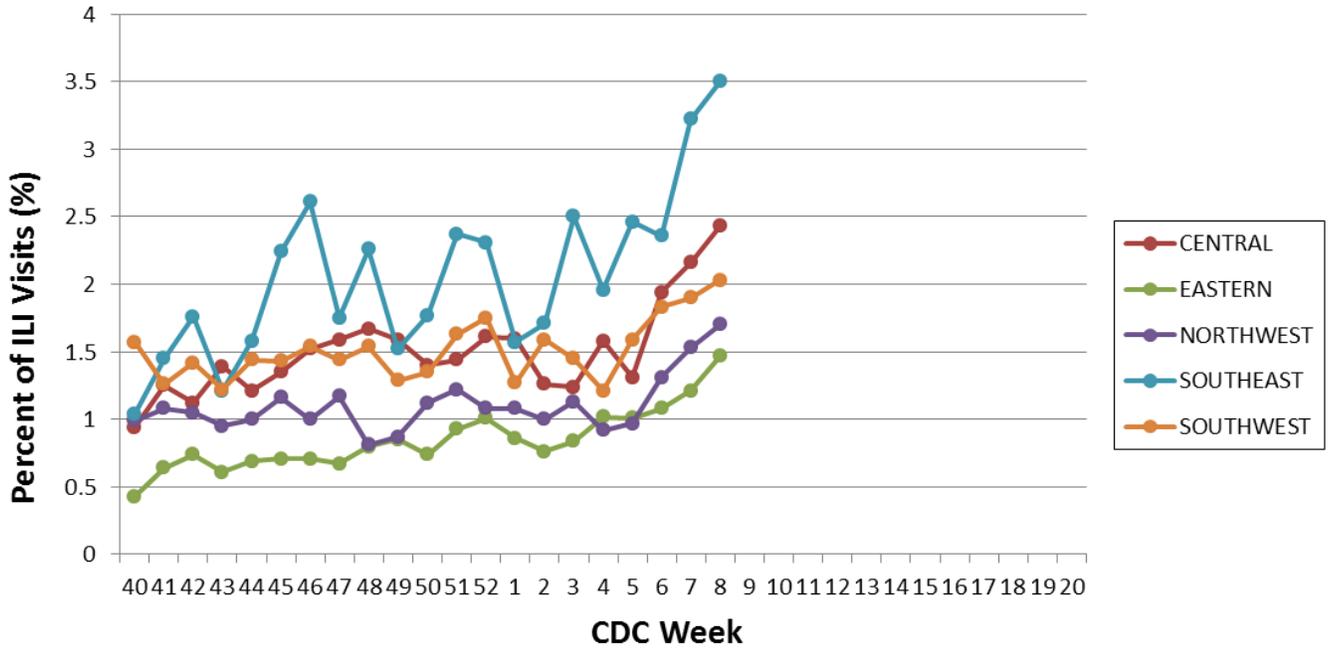

† ILI % for week 53 was estimated for previous seasons by averaging values for weeks 52 and 1 in order to compare to the ILI % for week 53 of the 2014-15 influenza season.
